

Illustrative worked example: Evidence and Decision Matrix

Leadership Masterclass · C904 · v4.0 · Fictional practice material

Fictional scenario

Meridian must choose a handover support option. Option A has quality/cost/resilience scores 4/3/4; B has 3/5/2. Scores use a fictional 1–5 scale where higher is better. Weights are 0.4/0.3/0.3.

Criteria, direction and weights

Higher scores are better. Quality 0.4; cost 0.3; resilience 0.3.

Option A: initial score and rationale

$0.4 \times 4 + 0.3 \times 3 + 0.3 \times 4 = 3.7$.

Option B: initial score and rationale

$0.4 \times 3 + 0.3 \times 5 + 0.3 \times 2 = 3.3$.

Sensitivity: weights 0.2 / 0.6 / 0.2

$A = 0.2 \times 4 + 0.6 \times 3 + 0.2 \times 4 = 3.4$. $B = 0.2 \times 3 + 0.6 \times 5 + 0.2 \times 2 = 4.0$. The ranking reverses.

Unknown evidence and potential bias

UNKNOWN: rating source, sample size and evidence quality. A preferred supplier could influence scoring.

Recommendation, owner and review trigger

A leads under the original weights, but verify the scores and criteria before committing. Proposed owner: team lead. Review if verified evidence or agreed priorities change.

Reflection and next action

One improvement: name the owner, the evidence and the next review date.

This is one possible response. Other reasoned choices can be appropriate.
